

DANIEL PANCU

AI Product Operations Builder | AI-Assisted App Builder | QA-Driven Product Improver

Romania / Remote | daniel.pancu@outlook.com | Portfolio / GitHub / LinkedIn: available on request

Professional Summary

AI-assisted product builder with a QA background, focused on turning ambiguous product and workflow problems into usable MVPs, automations, checks, documentation, and release-ready assets. Hands-on with Android apps, Chrome extensions, landing pages, Supabase backends, OpenAI/API integrations, product validation, bug reproduction, and release blockers. Strong match for Storyteller's AI Product Operations work: investigate behavior, use AI for leverage, apply judgment, and ship improvements others can trust.

Best Match to Storyteller

- Owns messy problems end-to-end: spots friction, frames what matters, prototypes a first version, validates behavior, and documents the result.
- Uses AI beyond surface-level prompting: planning, code generation, debugging, refactoring, workflow checks, classification/transform tasks, and release checklists.
- Technical and product-minded: comfortable with APIs, JSON, JWT, Supabase Edge Functions, OpenAI integrations, permissions, dependencies, store packaging, and failure modes.
- QA discipline: bug reproduction, regression testing, feature validation, edge-case thinking, build verification, user-flow testing, and clear product feedback.

Selected AI / Product Projects

LearnLift AI - Android AI Study Coach | Active development

- Building an Android AI study coach using Kotlin, Jetpack Compose, Supabase Edge Functions, JWT-based backend calls, and OpenAI-powered AI Coach features.
- Implemented learning flows around questions, answers, explanations, AI feedback, and test readiness while validating backend responses and user-facing behavior.
- Handled practical release blockers: API quota errors, backend response parsing, version/AAB issues, health declarations, Play Console closed testing, and store description readiness.

RoleForge - Chrome Extension for Job Seekers | AI-assisted browser product

- Built and prepared a Chrome extension that turns job posts into tailored CVs, cover letters, and application answers for high-volume job seekers.
- Worked through Chrome Web Store packaging, local unpacked testing, versioning, production/dev login behavior, popup and side-panel flows, and submission steps.

CoinRelic - Mobile App for Coin Collectors | Product concept and release assets

- Created app direction for scanning, identifying, valuing, and organizing coins in a digital collection, including saved collections, watchlists, and rare coin discovery.
- Developed Play Store positioning, ASO-friendly descriptions, feature graphics, screenshots, store experiments, and release-oriented assets.

Portfolio / DCP Labs | AI-assisted app builder brand

- Created a portfolio direction with case-study style project sections, technology highlights, Google Play developer branding, screenshots, and product presentation assets.

Relevant Background

Independent AI-Assisted App Builder | 2025 - Present

- Uses AI tools to plan, generate, debug, test, polish, and release real products across Android, web, and browser extension workflows.
- Combines product thinking, QA discipline, and rapid prototyping to move from idea to usable MVP without waiting for a large team or perfect brief.

Games QA / Software QA Background | Prior experience

- Experienced in bug reporting, regression testing, feature validation, edge-case thinking, build verification, and quality-focused product feedback.
- Applies QA judgment to AI-assisted development by identifying broken flows, unclear UX, weak prompts, backend issues, inconsistent AI/API responses, and release-blocking bugs.

Technical and Product Toolkit

AI and automation: OpenAI Codex, ChatGPT, prompt-driven implementation, AI-assisted refactoring, workflow checks, debugging AI/API responses

Product operations: problem framing, rapid prototyping, workflow improvement, release validation, documentation, product positioning, ASO/store readiness

Technical stack: Kotlin, Jetpack Compose, Flutter / Dart, JavaScript, Chrome Extensions, Supabase, Edge Functions, Firebase basics, REST APIs, JSON, JWT, OpenAI API integrations

QA and validation: manual testing, bug reproduction, regression testing, user-flow testing, build verification, edge-case analysis, clear bug reports
